

Howdy friends, my name is Winder Lyons. I want to talk a little bit about zeolites. Zeolites are a wonder of nature. They're a negatively charged mineral and they're found everywhere on the planet. Wherever lava contacts seawater, zeolites form. But they have an unusual property. They attract toxins and they bind them. So everywhere in nature you find zeolites, they're dirty. They have to be cleaned. When you take a zeolite that has been grown in the lab that has no contamination and is uniform in size, it has exposed sites that attract and bind all positively charged toxins. Primarily heavy metals or insecticides, pesticides, herbicides, chemicals. Even the coating of certain cancer cells. If a cancer cell has a fibrin coating, which has a positive charge, the zeolite will remove it. And that allows the body to get in and deal with that cell the way it's supposed to, whereas otherwise it can't.

But anywhere in your body that you have a virus, a bacteria, a parasite – anything that excretes toxic substances, the zeolite will clean all of that out. It's too small to kill. It doesn't kill anything, it doesn't interact with your body biologically in any way. All it is like liquid flypaper. It courses through our systems, removing everything that's not supposed to be there and allowing us to wake up and function as intended.

What happens is we get trillions of particles of heavy metals clogging the entrances to our cells, disrupting cellular communication and uptake of nutrients, etc. Zeolite cleans all that garbage out and allows us to optimize our functioning. It's like we reboot, we come back to life. The things we see and the stories we hear are truly, truly remarkable. So Coseva has the product called Advanced TRS, which is a lab-grown zeolite that has been handled so meticulously, it's been nanosized so it's literally 100 times more effective than any other zeolite product we have ever encountered in all the years that we have been doing this.

So tune into this. Do yourself and those you care about a tremendous favor. Check out the science behind this stuff. Read the studies. We have pages and pages of references, white papers, and all the science anybody would want to chew on to understand this stuff and how it works. And then do yourself a great favor, get some, try it, share it with the people you love and watch what happens.
